I committed locally but haven't pushed yet. I want to combine the last two commits into a single commit with a new message. 13:21
Thought for 1s
Shell Inspect worktree and latest commits 3 lines… 14s
git status --short --branch; git --no-pager log -2 --format="%h %s"
Thought for 2s
Shell Check commit ancestry and upstream status 11 lines… 7s
git --no-pager log -3 --format="%H%n%P%n%s"; git branch -vv
Asked user The latest two commits are `72fb2e8` and merge commit `96e1d3c`. Your branch currently matches `origin/main`, so the local tracking ref says these commits are already o… 3m 14s
User cancelled the request.
Thought for 1s
I made no changes. The request was cancelled; the local origin/main tracking ref currently matches your latest commit, so these commits appear to be already pushed.
I only want the command, not to execute it. Please show me the exact git command I would run to combine the last two commits into one with a new message, and explain it. 13:25
git reset --soft HEAD~2
git commit -m "Your new commit message"
git reset --soft HEAD~2 moves the branch back two commits while keeping their combined changes staged. The new git commit records those changes as one commit with your chosen message.
Since one of the two commits is a merge commit, this combines its resulting changes but does not preserve the merge topology.
Your origin/main tracking ref appeared to match your latest commit, so check whether the commits are actually pushed before rewriting them; if they are, updating the remote would require a force-push.

Prompt Used:
I committed locally but haven't pushed yet. I want to combine the last two commits into a single commit with a new message.

Command Suggested by Copilot:
git reset --soft HEAD~2
git commit -m "Your new commit message"

Accuracy Ranking and Justification:
Accuracy Ranking: 9 out of 10

Justification: Copilot suggested the standard professional approach, using git reset --soft HEAD~2 to move the branch back two commits while keeping their changes staged, followed by a single git commit to create the combined result. It also correctly warned that my local branch matched origin/main and that rewriting already pushed commits would require a force push, which shows it understands the difference between local and shared history. The only reason I did not give a perfect score is that an interactive rebase would give more control over the final commit message, but Copilot's choice is still correct and simpler.
